ReadyMynd | Textile DPP Readiness & Digital Advisory

Know Your Digital Readiness Before Deciding What Comes Next.

Understanding Your Factory's Digital Readiness

ReadyMynd helps Bangladesh's textile and apparel manufacturers understand their digital readiness for emerging EU Textile Digital Product Passport (DPP) expectations.

Our locally developed assessment software tools and Enterprise Analysts examine existing capabilities, identify digital gaps and recommend practical improvement priorities.

Your Product Information Exists. But Is It Ready to Be Used?

Factories maintain information in Tech Packs, Bills of Materials (BOMs), supplier documents, production records, spreadsheets and enterprise systems.

Information may be incomplete, inconsistent or disconnected across departments. Understanding existing capabilities supports informed decisions before investing in additional technology.

A Structured Assessment of Your Factory's Digital Capabilities

One Product. One Factory. A Practical Starting Point.

Each engagement examines one representative product at one physical factory, with coverage tailored to its activities, departments and information environment.

Software tools support questionnaires, scoring, gap analysis and reporting. Enterprise Analysts evaluate evidence, interpret findings and determine recommendations.

Five Dimensions of Digital Readiness

Manual Data & Information: Availability, completeness and accessibility of manually maintained product information.

Digital Data & Information: Digital information availability, quality, accessibility and supporting system capabilities.

Data & System Integration: Connectivity, information exchange and interoperability.

Data Validation, Verification & Auditability: Information reliability, supporting evidence, validation controls and audit trails.

Data Governance: Information ownership, accountability, maintenance, access and integrity.

Traceability is cross-cutting. These five dimensions are ReadyMynd assessment categories, not official EU regulatory categories.

Better Information. Better Management Decisions.

The assessment identifies missing product information, inconsistent records, disconnected systems and unclear data ownership across factory departments.

Factories can use the findings to respond more reliably to buyer requests, reduce repeated data collection and reconciliation, and improve existing systems before purchasing new technologies.

Prioritised recommendations and a proposed 90-day plan help management assign responsibilities, allocate resources and address the most important digital gaps.

Before investing in new technology or DPP preparation, management should establish existing capabilities, identify gaps and decide which improvements deserve priority.

Software-Enabled. Analyst-Led. Evidence-Based.

A Structured Process. Practical Management Outcomes.

How We Conduct the Assessment

ReadyMynd follows five steps: define scope, collect information and evidence, evaluate digital readiness, identify gaps and priorities, and report findings.

Evidence may include Tech Packs, BOMs, supplier records, certificates, spreadsheets and digital systems. Software tools support scoring and gap analysis; analysts interpret findings.

What Your Factory Receives

A Management-Ready Assessment Report

Assessment coverage and results: Scope and functional coverage, overall readiness findings and score, function-wise findings and scores, and five-dimension results.

Digital gaps and priorities: Cross-functional dependencies, identified weaknesses and prioritised improvement recommendations.

Proposed 90-day action plan: A practical starting point for management to organise subsequent improvements.

The factory owns its delivered report under the agreed engagement terms.

Assessment Scope & Duration

One Product. One Factory. Indicative duration: **10–15 working days**, depending on scope, complexity and information availability. The factory provides contacts, records and access; ReadyMynd evaluates evidence and reviews findings.

Why ReadyMynd?

Bangladesh-Based. Independent. Evidence-Based.

ReadyMynd combines local industry understanding, locally developed assessment software tools and professional enterprise analysis to evaluate Bangladesh's textile and apparel factory environments.

Our **Enterprise Analysts & Digital Strategists** provide independent, vendor-neutral recommendations grounded in documented findings and available evidence.

We maintain agreed confidentiality arrangements, clear service boundaries and responsible reporting.

Optional Digital Advisory Services

After completing a paid assessment, factories may separately engage ReadyMynd for **Data Advisory, Digital Systems Advisory or System Integration Advisory**, based on identified technical gaps.

These optional, separately contracted services exclude business process redesign, software development, deployment and system implementation.

Start with Your Factory's Current Digital Capabilities

Understand what you have. Identify what needs improvement. Decide what comes next.

Request a Textile DPP Digital Readiness Assessment.

The assessment is not a regulatory audit, DPP compliance certification or product endorsement. It does not guarantee future compliance or buyer acceptance.
